

**Be more competitive and increase your profitability**

**Project Suite** is a leading financial management system for project-based companies, dedicated to optimizing your business by offering multi-company, inter-departmental and multi-currency capabilities.

- **Multi-company, inter-departmental and multi-currency management**
- **Scalable** to adapt to company growth
- **Flexible** customer & project billing rules
- **Detailed** organizational breakdown structure
- **Customizable** to match company image

Project Suite is fully integrated to Microsoft Dynamics GP as well as to Microsoft's full range of products. This allows for a robust financial solution and to take advantage of additional capabilities within daily tools such as:

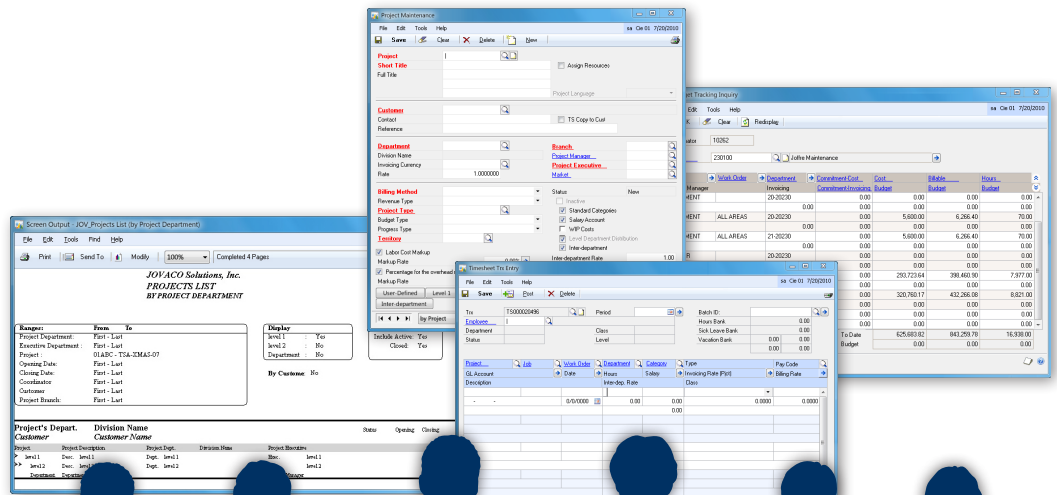

- **MS-Excel** to analyze your data in real-time through an extensive number of reports
- **MS-Outlook** to easily share reports, account statuses and invoices with others
- **Microsoft SQL** to create and integrate personalized business rules

**A complete solution**

A fully scalable solution to help you build a lucrative project-based business and to give you the tools you need to deliver projects on time, on budget and within scope.

**Project Suite** is a complete solution integrated with Microsoft Dynamics GP to offer:

- **Real-time cost and project updates**
- **Reduction of billing cycles**
- **Online collaboration and planning**
- **Web-based time and expense entry**
- **Automated distribution of management reports**
- **Over 20,000 users**

## Project Control

**Project Control** the core module within Project Suite incorporates the financial operations to professional service automation to help you define projects and their relationships through: projects, phases, budgets, resources, cost rates and utilization.

With detailed organizational and work breakdown structures, automatically distribute your organizations inter-departmental, multi-company and joint venture charges directly to a project. Accurately report earnings by mixing and matching multiple revenue recognition methods such as: time & material, project progress, elapsed time, or specific periods.

Accurately measure work team productivity by determining the time allocated to a project, which includes billable and non-billable hours.

## Professional Invoicing

**Professional Invoicing** meets diverse client billing requirements and is able to adapt to a variety of contract terms.

Bill projects partially or in their entirety, across multiple projects or companies in order to adjust to different parameters and with the option to include budgeted amounts, invoiced to date and previously invoiced.

This module is integrated to accounts receivable and Project Cost Control to enable you to generate transactions directly with Dynamics GP in one step to help avoid multiple entries.

Establish schedules for fixed rate invoicing and automate invoice generation. Customize different invoicing templates for each project or sub-project (phases) using Microsoft Word.

## Time & Expense

**Time & Expense** capture from remote locations is possible from any operating system, from anywhere in the world. Beyond basic data capture, this module provides project management functionality, simple or complex approval processes and integration to resource planning.

Submit time, incurred expenses and internal fees in multiple currencies within a single expense statement. Once the information has been captured, the projects are updated to create transactions and produce reports to give you up-to-date information on the profitability and productivity of all your projects by phase, activity or resource.

TEDI's visual project structure makes it quick and easy to capture data by displaying and sorting projects by project or by department in a hierarchical view to speed up your data entry while adhering to your corporate resource utilization.

**Web Reports** enables Project Managers to review information and to track the status of their multiple projects, in real time from anywhere via the Web.

Due to the extensive organizational breakdown structure, users can only access information from projects within their user group based on the roles defined in Project Cost Control with no mapping required. This module has the capabilities to send automated reports on a date and time specified to particular groups based on their roles. Project Managers are independent from Administration for updates on their projects since they may now generate this unique data through queries themselves.

Reports are available with multiple criteria options to allow users to display the data they want included in their report. Once created, users can export it in different formats according to the purpose for which this report is intended.

**Resource Planning** allows you to allocate resources to the tasks that needs to be scheduled over a fixed period of time, to allow for quick responses to schedule changes and to manage possible cost overruns.

This module automatically enters and calculates the time allocated within an employee's timesheet based on the project completion date, percentage of time already charged and the number of resources assigned to a particular project.

Plan & assign project tasks and manage project portfolios to have a better handle on the capacity of all resources. Track progress by project, department and resource and benefit from bi-directional integration to timesheets. Finally, review project statuses with Gantt charts views, budgets-to-actuals statements and variance reporting.

**Web Requisitions** provides an electronic requisition to issue and process purchase orders within an extensive approval system. This system could be used to manage all the requisitions that occur within your company in order to have a complete view and more accurately follow the statuses of the requests in progress.

Categorize purchases and assign specific cost categories with the option to have requests approved by managers depending on a particular business rule. Set up your approval process by purchase category or by amount range to apply to a group or specific resource. Modify details to ensure that the information transmitted to your suppliers is compliant and meets your internal processes.

## An experienced team

Founded in 1983, JOVACO Solutions is one of the few information technology firms specialized in enterprise software management with almost 30 years of experience.

JOVACO Solutions implements and provides consulting for Microsoft Dynamics GP and Microsoft Dynamics CRM. JOVACO also develops a vertical solution fully integrated to Dynamics GP and Dynamics CRM to manage projects, time & expenses and resource planning with business intelligence capabilities.

JOVACO Solutions consultants have professional designations, Microsoft certifications and are experienced in the implementation and support of hundreds of businesses across North America.

## A committed partner

JOVACO Solutions offers a complete range of services to ensure that customers obtain the best possible return on investment, and offers customers & partners the convenience of working with a vendor who is able to meet all their business needs.

Our commitment is customer service excellence with employees who offer expertise, professionalism and high quality standards.

“We’ve been using JOVACO’s services since November of 1995. Their business philosophy corresponds perfectly with CROP’s, that is impeccable customer service, excellent quality-to-price ratio and great insight into customer’s needs.”

CROP - Marketing Research firm

“JOVACO understands the needs of our sector. We could not find any other project accounting tool that met our requirements to such a great degree.”
